1. Introduction & Overview

SMC Master Pro is a comprehensive TradingView indicator designed for traders who follow Smart Money Concepts (SMC), Inner Circle Trader (ICT) methodology, and price action trading. It combines multiple high-probability trading strategies into a single, easy-to-use tool with intelligent confluence scoring.

What This Indicator Does

- **Identifies Market Structure:** Automatically detects BOS (Break of Structure) and CHoCH (Change of Character) to track trend direction and reversals.
- **Plots Order Blocks:** Highlights institutional buying and selling zones (Bullish and Bearish Order Blocks) with automatic mitigation tracking.
- **Detects FVG & BPR:** Shows Fair Value Gaps (imbalances) and Balanced Price Range zones — the strongest entry points in SMC.
- **Draws Fibonacci Golden Zone:** Auto-plots the 50%–78.6% retracement zone for sniper entries.
- **Premium/Discount Zones:** Visualizes PD Arrays so you buy in discount and sell in premium.
- **Liquidity Mapping:** Detects Buy Side Liquidity (BSL) and Sell Side Liquidity (SSL) zones where stop-loss hunting occurs.
- **Multi-Timeframe Analysis:** Confirms trend direction across 3 higher timeframes simultaneously.
- **Confluence Scoring:** Assigns numerical scores to entry signals based on multiple aligned factors.
- **Risk:Reward Calculator:** Auto-draws SL, TP, and R:R ratio on every signal.
- **Smart Alerts:** Sends notifications only when high-quality confluence signals appear.

Who This Is For

This indicator is designed for intermediate to advanced traders familiar with SMC/ICT concepts. Beginners can still use it effectively by following the included DATE framework workflow. Suitable for:

- Forex traders (scalping, day trading, swing trading)
- Cryptocurrency traders (BTC, ETH, altcoins)
- Stock and index traders
- Commodity traders (gold, oil, etc.)

Important Disclaimer

This indicator is a technical analysis tool, not financial advice. Always practice proper risk management, never risk more than you can afford to lose, and verify signals with your own analysis. Past performance does not guarantee future results.

2. Installation Guide

Follow these steps to install SMC Master Pro on TradingView. The entire process takes less than 2 minutes.

Step-by-Step Installation

1. Open TradingView and load any chart (e.g., EURUSD, BTCUSDT, etc.)
2. Click on the Pine Editor tab at the bottom of the screen. If you don't see it, click View → Pine Editor.
3. If there's any existing code in the editor, select all (Ctrl+A / Cmd+A) and delete it.
4. Copy the complete Pine Script code provided separately and paste it into the editor.
5. Click the Save button at the top right of the Pine Editor. Give it a name like 'SMC Master Pro'.
6. Click Add to chart. The indicator will appear on your chart with all features active.
7. Click the gear icon next to the indicator name to access all settings.

System Requirements

Requirement	Details
TradingView Plan	Free plan works. Premium recommended for multiple alerts and more indicators per chart.
Pine Script Version	v5 (built into all current TradingView accounts)
Browser	Chrome, Firefox, Edge, Safari (latest versions)
Markets Supported	Forex, Crypto, Stocks, Indices, Commodities, Futures — any market with OHLC data
Timeframes	1m through Monthly — all timeframes supported

3. Settings Reference

Every setting in the indicator is documented here. Click the gear icon next to the indicator name in TradingView to access these settings.

3.1 Multi-Timeframe Analysis Group

Setting	Default	Description
Higher TF #1 (Direction)	60 (1H)	First higher timeframe for trend direction. Should be 4-6x your current chart timeframe.
Higher TF #2 (Bias)	240 (4H)	Second higher timeframe for stronger bias confirmation.
Higher TF #3 (Major)	D (Daily)	Major timeframe for institutional trend direction.
Show MTF Dashboard	On	Toggles the top-right info panel showing trend status across all timeframes.

3.2 Market Structure Group

Setting	Default	Description
Swing Length	10	Number of bars on each side required to confirm a swing high/low. Higher = fewer but stronger swings. Lower = more frequent but weaker.
Show BOS	On	Displays Break of Structure lines (trend continuation).
Show CHoCH	On	Displays Change of Character lines (trend reversal — very important).
Show Swing Labels	Off	Shows SH/SL labels at each swing point. Turn on for learning, off to reduce chart clutter.

3.3 Order Block Group

Setting	Default	Description
Show Order Blocks	On	Master toggle for Order Block detection.
Max Active OBs	5	Maximum number of active Order Blocks displayed per side (bull/bear). Older OBs are removed.
Remove Mitigated OBs	On	When price touches an OB, it turns gray and shows 'Mitigated'. Recommended ON.

Setting	Default	Description
Bullish/Bearish OB Color	Green/Red	Customize the colors for visual preference.

3.4 FVG & BPR Group

Setting	Default	Description
Show FVG	On	Toggles Fair Value Gap (imbalance) display.
Show BPR	On	Detects BPR (Balanced Price Range) — the overlap of two opposite FVGs. Strongest entry zone.
Min FVG Size %	0.1	Filters out tiny FVGs. Increase to 0.3-0.5 on lower timeframes if too many small FVGs appear.

3.5 Other Groups

The remaining setting groups (Fibonacci, Premium/Discount, Liquidity, Entry Signals, Risk Management, Alerts) follow the same pattern: a master toggle, color customization, and feature-specific parameters. Hover over any setting in TradingView to see its tooltip.

4. Feature Documentation

Deep dive into how each feature works and how to interpret it on your chart.

4.1 Market Structure (BOS & CHoCH)

Market structure tells you whether the market is in an uptrend, downtrend, or in transition. The indicator uses wick-based swing detection (not body-based) for maximum accuracy.

BOS — Break of Structure

A BOS occurs when price breaks the previous swing high (in uptrend) or swing low (in downtrend), confirming trend continuation. Displayed as a dashed line with 'BOS ' or 'BOS 

- **Bullish BOS:** Price breaks above previous swing high → uptrend continues. Look for long entries on pullback.
- **Bearish BOS:** Price breaks below previous swing low → downtrend continues. Look for short entries on retracement.

CHoCH — Change of Character

A CHoCH is the first sign of trend reversal. It occurs when price breaks structure in the opposite direction of the prevailing trend. Displayed as a solid colored line with 'CHoCH 

Pro Tip

CHoCH signals are far more reliable when they align with multi-timeframe bias change. Wait for the MTF Dashboard to confirm before trading a CHoCH reversal.

4.2 Order Blocks

An Order Block is the last opposite-colored candle before a strong impulsive move. It represents the price zone where institutional traders placed large orders. Price often returns to these zones before continuing in the original direction.

How to Identify

- **Bullish OB (Green box):** The last bearish (red) candle before a strong bullish impulse. This is a buying zone.
- **Bearish OB (Red box):** The last bullish (green) candle before a strong bearish impulse. This is a selling zone.
- **Mitigated OB (Gray box):** Once price has touched the OB, it becomes mitigated. Do not trade mitigated OBs — they have lost their power.

Trading Rules for OBs

8. Wait for price to return to an unmitigated OB.
9. Confirm with MTF trend direction (MTF Dashboard must align).
10. Look for entry trigger (engulfing candle, rejection wick).
11. Place SL below/above the OB with a small buffer.
12. Target minimum 1:3 R:R.

4.3 Fair Value Gap (FVG) and BPR

An FVG is a 3-candle pattern where there's an unfilled gap between the 1st candle's wick and the 3rd candle's wick. It represents market inefficiency that often gets filled.

Feature	FVG	BPR
Structure	Single 3-candle gap	Two opposite FVGs overlapping
Reliability	Good (can be traps)	Excellent
Visual Color	Blue (bull), Orange (bear)	Yellow
Use Case	Imbalance detection	Sniper entry point

BPR Priority

When you see a yellow BPR box on your chart, that is the highest-probability entry zone available. Always prioritize BPR over standalone FVG.

4.4 Fibonacci Golden Zone

The Golden Zone is the area between 50% and 78.6% Fibonacci retracement levels. Statistically, the highest-probability reversals occur within this zone, especially at 61.8%.

How It's Drawn

- **In Uptrend:** Drawn from the most recent swing low to swing high. Retracements into the zone are buying opportunities.
- **In Downtrend:** Drawn from the most recent swing high to swing low. Retracements into the zone are selling opportunities.
- **61.8% Line:** Dotted orange line — the most powerful Fibonacci level. Watch for reactions here.

4.5 Premium/Discount Zones (PD Array)

The PD Array divides the range between the most recent swing high and swing low into two halves at the 50% midpoint (Equilibrium):

- **Premium Zone (Red, upper half):** Above 50% — favored zone for selling. Smart money sells from premium.
- **Discount Zone (Green, lower half):** Below 50% — favored zone for buying. Smart money buys from discount.
- **Equilibrium Line (White dashed):** The midpoint. Avoid trading when price is exactly here — wait for it to move into a zone.

4.6 Liquidity Zones

Liquidity refers to clusters of stop-loss orders that smart money targets before making the real move. The indicator marks:

- **BSL (Buy Side Liquidity):** Equal highs — many traders place stops above. Red dotted line.
- **SSL (Sell Side Liquidity):** Equal lows — many traders place stops below. Green dotted line.

Liquidity Sweep Strategy

Smart money often pushes price beyond liquidity zones to trigger stops, then reverses sharply. Don't trade directly into liquidity — wait for the sweep, then enter on the reversal with CHoCH confirmation.

4.7 Engulfing Entry Signals

The indicator marks bullish and bearish engulfing patterns with BUY/SELL arrows. These only appear when confluence requirements are met (see Section 7).

- **Bullish Engulfing:** Current green candle fully engulfs previous red candle's body. Appears in uptrend + discount zone for valid signal.
- **Bearish Engulfing:** Current red candle fully engulfs previous green candle's body. Appears in downtrend + premium zone for valid signal.

4.8 Risk:Reward Visualization

When a valid BUY or SELL signal triggers, the indicator automatically draws three lines:

- **Blue line:** Entry price (current close).
- **Red dashed line:** Stop Loss — placed below the previous candle's low (BUY) or above the previous candle's high (SELL) with your configured pip buffer.
- **Green dashed line:** Take Profit — calculated using your R:R ratio setting (default 1:3).

5. Recommended Timeframe Setups

Choose the configuration that matches your trading style. The Higher Timeframe settings should always be larger than your active chart timeframe.

Trading Style	Chart TF	HTF #1 / #2 / #3	Best For
Scalping	1m – 5m	15m / 1H / 4H	Forex news, fast crypto
Day Trading	15m – 1H	1H / 4H / Daily	Forex, indices, gold
Swing Trading	4H – Daily	4H / Daily / Weekly	Crypto, stocks
Position Trading	Daily – Weekly	Daily / Weekly / Monthly	Long-term investing

Why Higher Timeframes Matter

Trading without higher timeframe confirmation is like driving without looking at road signs. The MTF Dashboard ensures you only take trades that align with the bigger trend, dramatically improving your win rate. When all three higher timeframes align (STRONG BULL or STRONG BEAR), confluence scores increase automatically.

6. Trading Workflow — The DATE Framework

Every trade should follow this 4-step checklist. Skipping any step increases your risk of taking low-probability trades.

D — Direction

Determine the overall trend direction using the MTF Dashboard:

- **Best Setup:** All 3 HTFs aligned (STRONG BULL or STRONG BEAR). Take only trades in this direction.
- **Acceptable:** HTF #1 and HTF #2 aligned, HTF #3 neutral. Trade with caution.
- **Skip:** Mixed signals across timeframes. Wait for clarity.

A — Area (Zone)

Wait for price to reach a high-probability zone. Do NOT chase price in the middle of nowhere.

Acceptable zones:

- Unmitigated Order Block (matching the trend direction)
- BPR zone (highest priority)
- Fair Value Gap (FVG) entry
- Fibonacci Golden Zone (50%–78.6%)
- Premium zone for shorts / Discount zone for longs

T — Trigger

Once price reaches your zone, wait for a confirmation trigger:

- Bullish or bearish engulfing candle (BUY/SELL arrow appears)
- CHoCH on a lower timeframe (very strong)
- Rejection wick (long shadow into the zone, body closes back out)

E — Event

Before entering, check the economic calendar:

- Visit Forex Factory or your broker's news feed
- Avoid trading 30 minutes before and after high-impact news (red icon)
- Exception: If you specialize in news trading, use smaller position sizes and tighter stops

✓ Complete DATE Checklist

Before EVERY trade, confirm: ☐ Direction aligned across HTFs ☐ Area reached (OB/FVG/Golden Zone) ☐ Trigger candle confirmed ☐ Event calendar checked. If any box is unchecked, skip the trade.

7. Confluence Scoring System

The indicator automatically calculates a confluence score (0-6) for both bullish and bearish setups. Higher scores mean higher-probability trades.

How Scoring Works

Factor	Points	Notes
Internal trend matches signal direction	+1	Current timeframe
All MTF aligned (STRONG BULL/BEAR)	+2	Or +1 if only HTF #1
Price in correct PD zone	+1	Discount for BUY, Premium for SELL
Engulfing pattern present	+1	Required for signal trigger
Active unmitigated OB present	+1	Matching direction
MAXIMUM SCORE	6	Perfect setup

Score Interpretation

- **Score 5-6:** A+ setup. Take with full position size.
- **Score 4:** Strong setup. Take with normal size.
- **Score 3:** Acceptable. Take with reduced size or skip.
- **Score 1-2:** Low quality. Skip — wait for better opportunity.

Adjusting Minimum Score

The 'Min Confluence Score' setting (default 3) determines when BUY/SELL arrows appear. Increase to 4 for fewer but higher-quality signals. Decrease to 2 for more signals (not recommended for beginners).

8. Setting Up Alerts

Never miss a trading opportunity. The indicator includes 10+ alert conditions that can notify you via email, mobile push, SMS, or webhook.

Available Alerts

- **BUY Signal:** Triggers on validated bullish entry with confluence.
- **SELL Signal:** Triggers on validated bearish entry with confluence.
- **BOS Bullish/Bearish:** Break of structure detected.
- **CHoCH Bullish/Bearish:** Trend reversal detected — most important.
- **Order Block Created:** New OB has formed.
- **FVG Detected:** New imbalance zone formed.

How to Create an Alert

13. Right-click on your chart and select 'Add Alert' (or click the alarm clock icon).
14. In the 'Condition' dropdown, select 'SMC Master Pro' indicator.
15. In the second dropdown, choose the specific alert (e.g., 'BUY Signal').
16. Set 'Options' to 'Once Per Bar Close' to avoid false triggers from intra-bar movement.
17. Choose notification method: pop-up, email, mobile (requires TradingView app), webhook, etc.
18. Customize the alert message if desired (use placeholders like {{close}}, {{ticker}}).
19. Click 'Create' — your alert is now active.

Recommended Alert Strategy

Best Practice

Enable 'Alert only on Confluence Signals' in settings. This filters alerts to only the highest-quality setups, preventing alert fatigue. Combine BUY/SELL alerts with CHoCH alerts for both entry signals and major reversal warnings.

9. Risk Management Rules

Even the best indicator cannot save poor risk management. Follow these rules religiously.

Position Sizing

- **1% Rule:** Never risk more than 1% of your account on a single trade. Conservative traders use 0.5%.
- **Max Daily Risk:** Stop trading for the day after 3 consecutive losses or after losing 3% total.
- **Max Open Trades:** Keep total simultaneous risk under 3% of account.

R:R Ratio Targets

Setup Quality	Minimum R:R	Win Rate Needed
Standard setup	1:2	34% or higher
Confluence 4+	1:3	26% or higher
A+ setup (BPR + OB + MTF)	1:5 to 1:8	Below 20% (very profitable)

The Power of 1:3 R:R

With a 1:3 risk-reward ratio, you can lose 5 trades in a row and still recover everything plus profit with just 2 winning trades. This is the mathematical foundation of profitable trading.

Stop Loss Placement Rules

- **Order Block entries:** SL goes just below (BUY) or above (SELL) the OB, plus a 2-3 pip buffer.
- **Engulfing entries:** SL goes below the engulfed candle's wick (BUY) or above (SELL) with buffer.
- **Golden Zone entries:** SL goes just beyond the swing high/low used to draw the Fib.
- **Never:** Place SL based on arbitrary pip distances. Always use structural levels.

10. Troubleshooting

Common Issues

Problem	Solution
Syntax error when saving	Make sure you copied the entire script. Check that no special characters were added during paste. Try copying again from a fresh source.
No signals appearing	Lower the 'Min Confluence Score' setting from 3 to 2. Or wait — high-quality setups don't appear every bar.
Too many signals (noise)	Increase 'Min Confluence Score' to 4 or 5. Enable 'Require Confluence'. Use a higher chart timeframe.
Chart looks cluttered	Turn off features you don't need: Liquidity, Swing Labels, or PD Zones. Reduce 'Max Active OBs' to 3.
Alerts not triggering	Make sure alert is set to 'Once Per Bar Close'. Check that the alert is enabled in TradingView. Free accounts have limits on active alerts.
MTF Dashboard shows wrong trend	Verify your HTF settings are larger than chart TF. Reload the chart. The trend uses EMA 20/50 crossover.
Indicator runs slowly	Reduce 'Max Active OBs' and disable features you don't use. TradingView's free plan has computational limits.

11. Frequently Asked Questions

Can I use this on the free TradingView plan?

Yes, fully. The indicator runs on any TradingView plan. However, premium plans allow more simultaneous alerts and indicators per chart.

Does it repaint?

Swing-based features (BOS, CHoCH, swing highs/lows) confirm after the swing length bars pass. This is by design — early confirmation would produce false signals. BUY/SELL entry signals appear on confirmed candle close and do not repaint.

What markets work best?

The indicator works on all markets with OHLC data. It performs best on liquid instruments: major forex pairs (EUR/USD, GBP/USD), top cryptocurrencies (BTC, ETH), major indices (SPX, NAS), and gold (XAU/USD).

Should I use it as a standalone signal generator?

No. Always combine indicator signals with your own analysis, market context, and the DATE framework. The indicator is a tool to identify high-probability zones, not a replacement for trader judgment.

Can I use it with automated trading bots?

Yes, via webhook alerts. Set alerts with JSON payload format and connect to your trading bot platform. However, fully automated trading on SMC concepts requires careful backtesting.

Why don't I see Golden Zone or PD Zones?

These zones only appear on the most recent swing structure when the chart is updated. They redraw on each new swing. Make sure 'Show Golden Zone' and 'Show PD Zones' are enabled in settings.

Can I customize the colors?

Yes. Every visual element has a color setting in the indicator inputs. Match your chart theme by adjusting OB, FVG, BPR, Golden Zone, and PD Zone colors.

Does it work in volatile or sideways markets?

BOS/CHoCH signals work best in trending markets. In sideways markets, focus on Premium/Discount zones and rely on confluence scoring. Avoid trading during major news events when volatility distorts structure.

12. Glossary

Term	Definition
BOS	Break of Structure — price breaks a previous swing high (uptrend) or low (downtrend), confirming trend continuation.
CHoCH	Change of Character — first sign of trend reversal; price breaks structure in opposite direction of prevailing trend.
MSS	Market Structure Shift — synonym for CHoCH used in some ICT terminology.
Order Block (OB)	The last opposite-colored candle before a strong impulsive move; represents institutional order placement zone.
FVG	Fair Value Gap — 3-candle pattern showing price imbalance; the gap between 1st and 3rd candle wicks.
BPR	Balanced Price Range — overlap of two opposite FVGs; the highest-probability entry zone in SMC.
SMC	Smart Money Concepts — trading methodology based on institutional order flow and price action.
ICT	Inner Circle Trader — trading methodology developed by Michael J. Huddleston; foundation of modern SMC trading.
Liquidity	Concentrations of stop-loss orders that smart money targets before making the real move.
BSL / SSL	Buy Side Liquidity / Sell Side Liquidity — equal highs/lows where retail stops cluster.
Premium Zone	Upper half of a price range; favored zone for selling.
Discount Zone	Lower half of a price range; favored zone for buying.
Equilibrium	The 50% midpoint of a price range; neutral area between Premium and Discount.
PD Array	Premium/Discount Array — the structured zones derived from swing high to swing low.
Golden Zone	Fibonacci retracement area between 50% and 78.6%; high-probability reversal zone.
Mitigation	When price returns to and touches a zone (OB, FVG); the zone is then considered 'used up'.

Term	Definition
Impulse	A strong directional price move characterized by large candle bodies and momentum.
Sweep	When price briefly moves beyond a liquidity zone to trigger stops, then reverses.
Confluence	Multiple independent signals aligning at the same price area; increases trade probability.
R:R	Risk to Reward Ratio — the relationship between potential loss (SL distance) and potential profit (TP distance).
MTF	Multi-Timeframe — analyzing multiple chart timeframes simultaneously for confirmation.
HTF / LTF	Higher Timeframe / Lower Timeframe — relative to your active trading chart.
AMD	Accumulation, Manipulation, Distribution — three-phase market cycle theory used in ICT.

Happy Trading!

"Learning → Practice → Discipline → Success"

Remember: Take notes, control your emotions, practice consistently.

The market rewards patient, disciplined traders.
